

ABSTRACT

A method for obtaining antique-look slabs (10) made of stone agglomerate material has a first step of crushing the various materials of which the agglomerate consists, a
5 second step of mixing the crushed materials, to obtain as homogeneous a product as possible, during which the binding resins are added, a third step of preparing a shaped die on the base of which there is a first layer of paper, advantageously polyethylene-coated paper, a fourth step of
10 pouring the crushed materials into the die, a fifth step of covering the pressed agglomerate material with a second layer of paper, advantageously polyethylene-coated paper, a sixth step of pressing and compacting the agglomerate, during which the desired shape is obtained, a seventh step
15 of hardening the sheet or panel (10) at a predetermined temperature, an eighth step of separating the second layer of paper from the sheet (10), in which the second layer of paper is separated from the sheet (10) by simply lifting and removing the paper substantially in a single piece, leaving
20 the sheet (10) with an antique-look surface (11) in view.
